hantaviruses pdf

An orthohantavirus (or hantavirus) is a single-stranded, enveloped, negative-sense RNA virus in the Hantaviridae family of the order Bunyavirales. These viruses normally infect rodents, but do not cause disease in them. Humans may become infected with hantaviruses through contact with rodent urine, saliva, or feces.

Orthohantavirus - Wikipedia

Hantavirus Pulmonary Syndrome (HPS) is a severe, sometimes fatal, respiratory disease in humans caused by infection with hantaviruses. Anyone who comes into contact with rodents that carry hantaviruses is at risk of HPS.

CDC - Hantavirus Pulmonary Syndrome (HPS) - Hantavirus

Transmission by aerosolized rodent excreta still remains the only known way the virus is transmitted to humans. In general, droplet and/or fomite transfer has not been shown in the hantaviruses in either the pulmonary or hemorrhagic forms..
Diagnosis. According to Kevin Litman-Navarro, "HPS can be easy to overlook because its early symptoms are very similar to the flu.

Le genre Hantavirus décrit des virus appartenant à la famille des Bunyaviridae, parmi lesquels le virus Hantaan semble le plus dangereux.. L'humain est un hôte accidentel de ces virus, l'homme étant un des hôtes mammifères possibles. L'animal réservoir est un rongeur dont l'espèce varie selon les régions du monde :

SOR/2017-137 (3.1) If a liquid referred to in subsection (3) is a non-Newtonian substance or a flow cup method of viscosity determination is unsuitable, a variable shear-rate viscometer must be used to determine the dynamic viscosity coefficient of the liquid, at 23°C, at a number of shear rates. The values obtained must be plotted against shear rate and then extrapolated to zero shear rate.
